

The FAMI metal stacking and storage containers are the perfect solution for storing and handling the material that must be easy to access both in the warehouses and in production and assembly departments.

Made from mirror-finish cold-pressed sheet steel, they are strengthened by special ribbing on the sides and the bottom to increase load resistance and shock proofing.

A special feature, designed and produced by FAMI, allows the stacking and storage containers to be stacked perfectly one above the other even when fully loaded. These feature allows warehouse and transport space to be fully used. The reinforced raised edge ensures the container adheres perfectly to the next when being stacked.

To make the material easy to find, labels can be inserted in their relative holders at the front of the stacking and storage containers.
