

# POLYPROPYLENE STACKING AND STORAGE CONTAINERS

The FAMI polypropylene stacking and storage containers have been designed and produced to offer companies rational solutions to their various material storage and handling requirements.

First class raw materials, together with detailed structural research are the basis for this top quality product.

The wide range of containers is available in five colours to allow the storage of materials in easily recognisable categories.

The FAMI storage containers are eco-friendly as they can be totally recycled. The product, in fact, can be transformed into granules and totally reinserted into the production cycle of new containers.

The structures of the polypropylene stacking and storage containers are reinforced with sturdy ribbing at the critical points in order to withstand the heaviest of loads and be extremely shock resistant.

The lateral ribbing at the bottom of the FAMI polypropylene stacking and storage containers offers trouble-free stacking even when fully loaded.

The labels inserted in their relative holders allow the contents to be easily identified. Smaller label holders and larger one for longer descriptions are also available

Any size item can be stored within the wide range of available containers. A range of troughs to sub-divide the containers to suit any requirement permits the rationalisation of available space.
